

Supplemental Figure 2

(A)

(B)

Supplemental Figure 2. Urocortin-2 regulates the expression of proteins involved in Ca^{2+} homeostasis.

Representative immunoblots (top) and quantification (bottom) of protein expression of EPAC (A) and NCX (B), assessed by Western Blots, normalized to their corresponding β -actin. Proteins were examined in rat cardiac myocyte from Sham (Blue); from remote (green) and risk (red) zones isolated from hearts 1 week after I/R vs. Dashed green and red bars are for remote and risk zone of I/R+Ucn-2. Values are mean \pm SEM from 4-6 rats. * $p < 0.05$.
